Dissolvable gel helps protect tissues following sinus surgery
What is **STAMMBERGER SINU-FOAM™**?

Dissolvable dressing that allows for easy placement throughout the nasal and sinus cavities

STAMMBERGER SINU-FOAM is a CMC-based dressing intended to minimize bleeding and edema and to prevent adhesions between the septum and the nasal cavity. STAMMBERGER SINU-FOAM starts as a dry carboxymethylcellulose (CMC) fiber within a syringe. When properly mixed with sterile water, the CMC gels to form a viscous dissolvable foam that conforms to the nasal cavities while providing a moist, hydrocolloid physical barrier.

**STAMMBERGER SINU-FOAM is designed to:**
- Eliminate the need for painful post-op removal of packing
- Remain where placed and dissolve gradually through normal outflow in 7-10 days
- Be easily debrided using gentle suction if any foam remains in situ post-op
- Provide a moist environment

**Why CMC material?**

CMC is commonly used in pharmaceuticals and medical devices. Medical devices containing CMC, such as the RAPID RHINO® epistaxis dressings, STAMMBERGER SINU-FOAM dressing, and SEPIAFILM® bioresorbable membrane have been in clinical use over the last two decades.
STAMMBERGER SINU-FOAM®
Mixing Instructions

Step 1
Draw sterile water or Lactated Ringers solution up to the black line (~8ml) of the small syringe.

Step 2
Screw and connect the two syringes together.

Step 3
With the solution vertically on top, press the small syringe plunger so that all the solution wets the fiber in the large syringe.

Step 4
Mix the foam between the two syringes (10-15 times).

CRITICAL: During each pass, all the foam should move from one syringe to the other. Finish mixing the foam in the smaller syringe.

Step 5
Disconnect the two syringes and attach the cannula to the small syringe in preparation for deployment into the sinuses.
